Replicating Lemmon, Roberts, and Zender (2008)

Yongseok Kim

July 20, 2020

1 Introduction

In this paper, I replicate Lemmon, Roberts, and Zender (2008, Journal of Finance)'s results. In short, results are replicated well. However, it is hard to exactly replicate statistics on Industry median leverage. Moreover, I fail to replicate column (g) of Table 6, which estimates system GMM (Blundell and Bond, 1998).

2 Data and Variables

- Although LRZ define **Firm Size** as log(book assets) where assets are deflated by the GDP deflator in the appendix, they never use this variable. Instead, they use **Log(Sales)** which does not appear in the appendix. I use log(sale) where sales are deflated by the GDP deflator.

- LRZ do not clarify a definition of **Cash Flow Volatility**. I use 10 years standard deviation of historical operating income (**oibdp**), requiring at least 3 years of data.

- In the appendix, LRZ define **Net equity Issuance** as

$$(csho_t - csho_{t-1} \times \frac{ajex_{t-1}}{ajex_t}) \times (prcc\_f_t + prcc\_f_{t-1} \times \frac{ajex_t}{ajex_{t-1}}) \times \frac{1}{at_{t-1}}.$$

  I think this is a typo. Instead, I use

$$(csho_t - csho_{t-1} \times \frac{ajex_{t-1}}{ajex_t}) \times \frac{1}{2} \times (prcc\_f_t + prcc\_f_{t-1} \times \frac{ajex_t}{ajex_{t-1}}) \times \frac{1}{at_{t-1}}.$$

- I define **Dividend payer** as

$$I\{dvc_t > 0\}$$

  and **Intangible assets** as

$$\frac{intan_t}{at_t}$$

3 Results

- Table 1: Summary statistics are replicated well, except a standard deviation of **Industry median lev.**

- Figure 1 and 2: Main figures are replicated well.

- Table 2: The main table is replicated well. Exceptions are **Cash flow vol.** and **Industry median lev.**

- Table 3: The table is replicated well.

- Table 4: LRZ do not specify how they calculate standard errors of long-run impact terms. By the Delta method, I derive

$$
F(\theta) =
\begin{bmatrix}
\iota' & & & \\
& \iota' & & \\
& & \ddots & \\
& & & \iota'
\end{bmatrix}
$$

where
$$
\iota = [1, \cdots, 1]'
$$

and
$$
f(\hat{\theta}) - f(\theta) \approx F(\theta)(f(\hat{\theta}) - f(\theta))
$$
$$
=_d F(\theta)\mathbb{N}(0, V).
$$

Hence
$$
\mathrm{avar}(f(\hat{\theta})) = F(\theta)VF(\theta)'
$$
$$
=
\begin{bmatrix}
\iota'V_1\iota & & \\
& \ddots & \\
& & \iota'V_k\iota
\end{bmatrix}
$$

where V_j is $l \times l$ submatrix of variable j and l is a number of lags.

- Table 5: It is hard to get exactly same numbers.

- Figure 3: This figure is replicated well.

- Table 6: It is hard to replicate column (g).

  - **Half-life**: Let
    $$
    \mathrm{avar}(\lambda) = V.
    $$
  Define
  $$
  f(\lambda) = \frac{\ln 0.5}{\ln(1 - \lambda)},
  $$

  $$
  F(\lambda) = \frac{\partial}{\partial \lambda} f(\lambda)
  $$
  $$
  = \frac{\ln 0.5}{\ln(1 - \lambda)^2} \frac{1}{1 - \lambda}.
  $$

  By the Delta method, we obtain
  $$
  \mathrm{avar}(f(\hat{\lambda})) = F(\hat{\lambda})VF(\hat{\lambda})
  $$
  $$
  = \Big[\frac{\ln 0.5}{\ln(1 - \lambda)^2} \frac{1}{1 - \lambda}\Big]^2 V.
  $$

– β: Let

$$\text{avar}(-\lambda, \lambda\beta_1, \cdots, \lambda\beta_j) = V.$$

Define

$$f(-\lambda, \lambda\beta_1, \cdots, \lambda\beta_j) = [-\frac{\lambda\beta_1}{-\lambda}, \cdots, -\frac{\lambda\beta_j}{-\lambda}]'$$
$$= [\beta_1, \cdots, \beta_j]',$$

$$F(-\lambda, \lambda\beta_1, \cdots, \lambda\beta_j) = \frac{\partial}{\partial\theta'} f(\lambda, \lambda\beta_1, \cdots, \lambda\beta_j)$$
$$= \begin{bmatrix} \beta_1/\lambda & 1/\lambda & 0 & \cdots & 0 \\ \beta_2/\lambda & 0 & 1/\lambda & & \\ \vdots & \vdots & & \ddots & \\ \beta_j/\lambda & 0 & & & 1/\lambda \end{bmatrix}.$$

By the Delta method, we obtain

$$\text{avar}(\beta) = \frac{1}{\lambda^2} [\beta, I_j] V [\beta, I_j]'.$$

Table 1: Summary Statistics

	All Firms		Survivors
